### DETAILED ACTION

## Response to Amendment

1. Applicant's arguments have been considered but are moot in view of the new ground(s) of rejection in view of Huang et al. (US 5829000) necessitated by claim amendment.

## Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1, 3, 5, 13, 17, and 23-31 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pfister et al. (WO 96/03741, from IDS) in view of Franz et al. (US 6178401).
- 4. Regarding claims 1, 13, and 17, Pfister et al. disclose a method and a computer readable medium for inputting a text, comprising:
- (a) a step for inputting a sentence by speech (*input device 6 in figure 1; also referring to 2<sup>nd</sup> paragraph on page 28*);
- (b) a step for preparing word-string candidates which consist of one of several words from the inputted sentence by performing speech recognition processing (3<sup>rd</sup> paragraph page 18 and 2<sup>nd</sup> paragraph page 19; recognizing a current "speech"

Application/Control Number: 09/989,561

Art Unit: 2626

segment"; N most possible phoneme sequences within the speech segment, wherein the speech segment can be a single word or a phrase);

- (c) a step for displaying the prepared candidates (*last paragraph on page 21 to end of second paragraphs on page 22*); and
- (d) a step for selecting from among the displayed candidates (*last paragraph on page 21 to end of second paragraphs on page 22 and/or referring to pages 24-25*).

Pfister et al. fail to specifically disclose that the candidates prepared in the candidate preparing step (b) are obtained by repetition of an extension processing step (b1) for performing an extension of words, the extension processing step (b1) determining whether to link the words based on a word-based linkage probability obtained by a language model. However, Franz et al. teach that the candidates prepared in the candidate preparing step (b) are obtained by repetition of an extension processing step (b1) for performing an extension of words, the extension processing step (b1) determining whether to link the words based on a word-based linkage probability obtained by a language model (col. 5, line 6 to col. 6, line 67, particularly col. 6, lines 42-67).

Since Pfister et al. and Franz et al. are analogous because they are from the same field of endeavor, it would have been obvious to one of ordinary skill in the art at the time of invention to modify Pfister et al. by incorporating the teaching of Franz et al. in order to improve speech recognition accuracy.

Application/Control Number: 09/989,561

Art Unit: 2626

5. Regarding claim 5, Pfister et al. disclose an apparatus for inputting a text, comprising:

an input section for inputting a sentence by speech (*input device 6 in figure 1;* also referring to 2<sup>nd</sup> paragraph on page 28);

an utterance pre-processing section for extracting a feature amount of the speech inputted from the input section (pages 15-17);

a word candidate preparing section for preparing following word-string candidates from a fixed word-string by using a language model (*phoneme identification section on pages 15-19*);

a word-string preparing section for preparing a word-string candidates which consists of one to several words from the extracted feature amount and the word-string candidate by using the language model (*phoneme identification section on pages 15-19*);

a display section for displaying the prepared word-string candidates (page 20, line 1-36);

an operating section for a user to select from among the word-string candidates being displayed (*Display and Editing Mode and Phonetic Symbol String Editing sections on pages 20-22*); and

a candidate-preparation instructing section for instructing the word candidate preparing section to prepare the following word candidate from the word-string candidate selected by the operating section (*phoneme identification section on pages* 15-19).

Pfister et al. fail to specifically disclose that the word-string candidates prepared in the preparing section are obtained by repetition of an extension process for performing an extension of words, the extension process determining whether to link the words based on a word-based linkage probability obtained by a language model. However, Franz et al. teach that the word-string candidates prepared in the preparing section are obtained by repetition of an extension process for performing an extension of words, the extension process determining whether to link the words based on a word-based linkage probability obtained by a language model (*col. 5, line 6 to col. 6, line 67, particularly col. 6, lines 42-67*).

Since Pfister et al. and Franz et al. are analogous because they are from the same field of endeavor, it would have been obvious to one of ordinary skill in the art at the time of invention to modify Pfister et al. by incorporating the teaching of Franz et al. in order to improve speech recognition accuracy.

- 6. Regarding claim 3, Pfister et al. further disclose that the candidate preparing step (b) further including a process to update an arrangement of the candidates according to an acoustic score after the repetition of the extension processing (adaptive feedback section on pages 26-27).
- 7. Regarding claim 23, Pfister et al. fail to specifically disclose a method for inputting a text according to claim 1, wherein, in the step of repeating the candidate preparing step (b), the displaying step (c) and the selecting step (d), when a word-string

is selected in advance, the candidate preparing step (b) determines the word-string as the candidate based on either language information or acoustic information. However, Franz et al. further teach in the step of repeating the candidate preparing step (b), the displaying step (c) and the selecting step (d), when a word-string is selected in advance, the candidate preparing step (b) determines the word-string as the candidate based on either language information or acoustic information (*col. 3, lines 35-49*).

Since Pfister et al. and Franz et al. are analogous because they are from the same field of endeavor, it would have been obvious to one of ordinary skill in the art at the time of invention to modify Pfister et al. by incorporating the teaching of Franz et al. in order to reduce processing time by reducing the number of candidates.

8. Regarding claims 24, 26, 38, and 30, Pfister et al. fail to specifically disclose a method for inputting a text according to claim 1, wherein the extension processing step (b1) determines to link the words when a judgment is made for linking the words and not to link the words if the judgment is made for not linking the words. However, Franz et al. further teach that the extension processing step (b1) determines to link the words when a judgment is made for linking the words and not to link the words if the judgment is made for not linking the words (col. 6, lines 1-41, words are linked together based on path probability).

Since Pfister et al. and Franz et al. are analogous because they are from the same field of endeavor, it would have been obvious to one of ordinary skill in the art at

the time of invention to modify Pfister et al. by incorporating the teaching of Franz et al. in order to improve speech recognition accuracy.

9. Regarding claims 25, 27, 29, and 31, Pfister et al. fail to specifically disclose a method for inputting a text according to claim 1, wherein the extension processing step (b1) prepares longer word-string candidates when it is determined to link the words than if it is determined not to link the words. However, Franz et al. teach that the extension processing step (b1) prepares longer word-string candidates when it is determined to link the words than if it is determined not to link the words (col. 6, lines 1-41, obviously a word-string is longer if a word candidate is added the string than word-string without a candidate word added to it).

Since Pfister et al. and Franz et al. are analogous because they are from the same field of endeavor, it would have been obvious to one of ordinary skill in the art at the time of invention to modify Pfister et al. by incorporating the teaching of Franz et al. in order to improve speech recognition accuracy.

- 10. Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pfister et al. (WO 96/03741, from IDS) in view of Franz et al. (US 6178401), and further in view of Official Notice.
- 11. Regarding claim 9, Pfister et al. fail to specifically disclose that the apparatus is included in a cellular telephone. However, examiner takes official notice that cellular

Page 8

telephone having speech recognition capability is well known in the art. Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to incorporate speech recognition capability in the cellular telephone in order to enable users to dial telephone numbers by voice without having their eyes off the road while driving.

- 12. Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pfister et al. (WO 96/03741, from IDS) in view of Franz et al. (US 6178401), as applied to claim 1, respectively, and further in view of Huang et al. (US 5829000).
- 13. Regarding claim 4, the modified Pfister et al. fail disclose that the extension process is ended by reaching of the number of phrase candidates subjected to said extension process by a predetermined number as counted from a top rank in a language score. However, Huang et al. teach a re-sizeable correction that enables the user to set a limit on the number of candidate words/phrases to be displayed on the display for the user to select (referring to col. 7-8).

Since the modified Pfister et al. and Huang et al. are analogous art because they are from the same field of endeavors, it would have been obvious to one of ordinary skill in the art at the time of invention to further modify Pfister et al. by incorporating the teaching of Huang et al. in order to provide rapid correction of misrecognized words/phrases.

### Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Huyen X. Vo whose telephone number is 571-272-7631. The examiner can normally be reached on M-F, 9-5:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Richemond Dorvil can be reached on 571-272-7602. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
